

MAGUS

A Secure Message Switch System

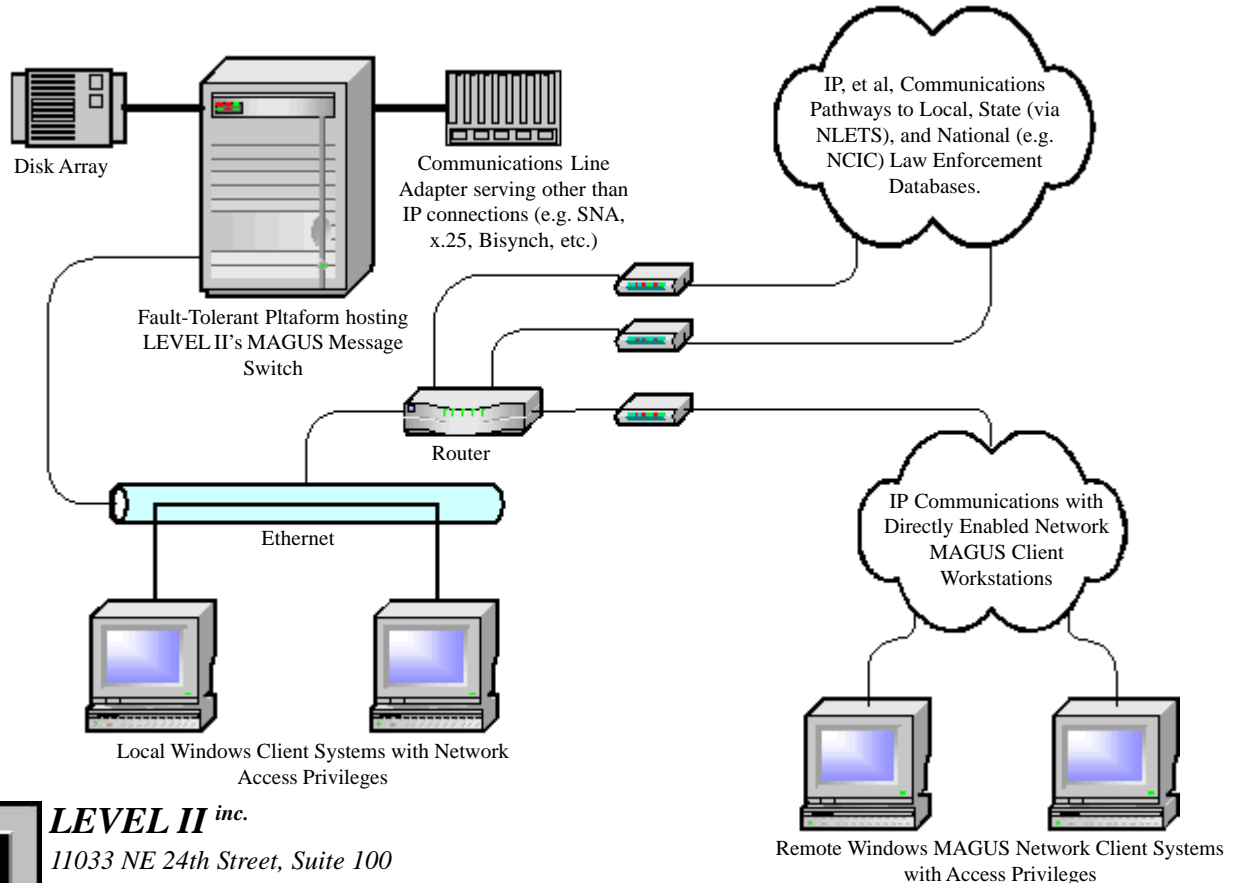

In 1979, **LEVEL II, Inc.** installed its message switch as the heart of ACCESS, the Washington State Patrol's statewide law enforcement communications network. The company has been providing sharply performing and supremely reliable public safety systems ever since.

Our switch, as several of our other products, embodies current open technical standards. These products include: (1) *The JOURNAL*, an intelligent archival adjunct of any message switch, and (2) **MAGUS**, the fifth generation descendant of our original ACCESS message switch.

MAGUS truly defines the state of its genre's art. It is what specialized store and forward message switches all must become. It allows administrators easily to define new transactions and their most complex processing. For example, it facilitates

easily spawning one or more transactions based upon the contents of another. The formats of transactions' presentations on their destination devices are centrally and simply alter-able by virtually any variable, such as device type, recipient's security level, etc. This switch's scalability is peerless, suiting it to agencies of every size, from small towns to the largest statewide law enforcement system. Its combination of advanced technical features, adaptability, certain reliability and scalability deem **MAGUS** nothing less than "best in class."

MAGUS comprises core software and transaction-specific scripting language programs through which its administrators can define new, or modify existing, transaction's presentation and behavior. Arrange to see this striking system demonstrated or ask us for a more detailed description.
